Capstone Project

Location and objective

- The project is in folder `4`, under `challenges` in the dev container, and is named `capstone`.
- The main task is to work in table groups to reverse-engineer the project's source-to-target mappings.
- Review the provided data and the tables to be produced; determine the required output tables and relevant STTM rules.
- The project data and materials were generated with ChatGPT and revised during attempts to make the project work in the repository. Some details may therefore be confusing or inconsistent.
- The instructor said they had spent time rationalizing the project but cautioned that additional AI-generated revisions had been made.

Terminology and model context

- Terms such as **portfolio** and **fund** may have meanings that differ from those in the CD model.
- In particular, **portfolio** does not refer to multi-manager portfolio construction.

Suggested project documentation

- A PRD, data contract, or similar documentation would be useful to produce during the initial work.
- This was presented as a desirable outcome, rather than a firm requirement.

Reading and Group Work

Individual reading

- Spend approximately 5–10 minutes reading the beginning of the Markdown file individually.
- The suggested amount is the first third, or at least the first quarter.

Table discussion and project phases

- Reconvene as a table at **9:15** to discuss what the project is asking the group to do.
- Aim to wrap up discussion around **10:00**, and no later than about **10:15**, to leave time for project work.
- Groups may end their discussion when ready.
- Phase two begins once everyone has completed phase one. Groups may finish phase one at different times.
- Groups that finish phase one early can move on to more open-ended, challenging questions intended for advanced technical practitioners.

Day Schedule and Debrief

Lunch and return

- Lunch is flexible; there is no fixed lunch time.
- Everyone should be back in the room by **1:30**.

End of day and presentations

- The instructor aimed to finish the day at about **1:45**.
- The schedule notes list presentations at **13:45**. The spoken description says a final 15-minute group debrief may take place if everyone has completed phase one by 1:45.
- The debrief could involve one representative from each table speaking for 2–3 minutes.
- Possible debrief topics include:
  - Team progress and what the group accomplished.
  - What was challenging or straightforward.
  - Where the team got to.
  - Use of Catalyst or design documentation.

Suggested points to highlight

- If senior leaders attend, consider mentioning **Catalyst**, the **paved path**, and the **mission**.

- If senior leaders are not present, share useful reflections on the day’s work or team experience.
- These were suggestions for the debrief, not stated requirements.

Additional Context

- The instructor welcomed additional attendees and mentioned that there might be merchandise prizes, though this was uncertain.
- The session was organized around table groups, with the initial discussion followed by project work.
