We've got some additional people today as well.
Alright, good morning, everyone. I'm gonna see if we've got some merch prizes today. I don't know, maybe we do. Maybe we don't. We at least have a single large, large decoded t-shirt.
There you go. Good job at each other. I like eagerness. This I always get Americans to be like, you know, eager and demanding and obnoxious. Capital group are all different but different, aren't you?
Yeah. Okay. Global globally minded. Uh-huh. Uh-huh. Southern, yeah, almost like Southern British people. Who are my natural enemies, by the way.
No, my natural enemy is a civil servant. I dislike civil servants. Very high in conscientiousness. Follow every rule to the letter. Doesn't matter.
You write down kill ten people, it'd be done very quickly. That's how the British trait works. Very efficient. No thinking. Yes. I'm just waiting for some people to arrive and sit down.
That's why I'm just. No, no, no. I'm just making sure the rules are being done. That's okay, that's okay. I'm just letting people sit down. But thank you for subtly ushering again.
Very British implications. This is Long Island. They just say, shut up, let's get started. Okay, brilliant. So uh now you um so what is the what is the plan for today?
Well the plan for today is in your uh folder number four in challenges in your dev container, yes. It's been um of course mysteriously named capstone, so if you haven't noticed that it's the capstone.
Now um you're all on tables, so those are reasonably good tables, right? You have people on the table, right? You've enough people. Um the first part is to reverse engineer what the source target mappings are for the project.
So to have a look at the data, have a look at what tables you are to produce, and then reverse engineer from the data you're given to what tables you're going to produce, uh what the SETM rules are.
That makes sense. Now um that's a little bit that can be a little bit confusing for

some people, because the data, all this is chat GPT out with zoo, right?
Obviously. Obviously. Um I have spent uh some time trying to um rationalize the uh project. However, every time it goes to platforms team to uh to uh to make work in the in the repo, uh get another wave of chat GPT over it.
So um I think it's fine. I think it's fine. However, important to point out is that the meaning of things like portfolio and funds and things might uh especially portfolio might be fairly different than the CG model of like off early construction, so it's not like multi-manding stuff.
Cool. And um now so you may want to spend like uh five minutes to ten minutes potentially reading through at least the first, let's say third, if not 25% of the uh markdown file yourself individually.
Give everyone sort of five to ten minutes, maybe nine fifteen. And then at nine fifteen come together as a table and just say, okay, what are we trying to do?
Now you can stop your group discussions whenever you like. So I would suggest that if you start at 9.15, probably you want to think about wrapping up at 10.
But certainly maybe by 10.15. Right, here you stop enough time to actually work in the project. It'd be good if as a result of um the first part of what you did that you have PRD documents or a data contract or something somewhere in the background that you could show.
And then you have from about 10.15 or whatever. So whenever you get phase whenever uh everyone is done phase one. So the end of the day commences when everyone is done phase one.
Now that means that you some people who are more uh advanced, let's say, we'll get phase one done faster, then there's a whole phase two of slightly more open questions, slightly harder questions, um, for advanced technical practitioners to do.
Um what else is there to say? Um I'm gonna aim to have the day finish about one forty-five. And I'm not going to set strict lunch time. I'm just gonna say go for lunch whenever you like.
Um so maybe ideally if we're all back in the room by 1.30 at the very least. Then

you can have lunch whenever you like. And if we uh if we if if everyone gets finished phase one by 145, then we can spend the last 15 minutes just having some kind of group debrief from each table.
Um that could just be one person from every table, potentially. Um I don't mind that. Um and it could just be for two or three minutes. It could just be something like you know, uh debriefing what you did in the in the team discussion, uh any kind of thoughts about what was hard, what was easy, where you got to as a team, things of that kind.
Cool. Uh maybe showing off um anything you did with catalyst or um how you use the design documentation and stuff like that. Cool? So if there were things you needed in the room, and I don't know if there are, probably aren't.
But if there were, one of the things I advise you to mention would be mentioning catalyst, mentioning the paved path, mentioning things about the mission, etc.
Um I'll ask the call if there are any CD is coming. Um if there are, I suggest you do those things to show that you've been properly programmed.
You might have been EO branded, right? You open the skull and there's a paid path there somewhere. Uh but if at least you leaders aren't there, you might want to say something exactly with DXP hand.
You might just want to say something, I don't know, interesting about your experience in the day or something, or what you did, or makes sense. Cool.
Alright, so I'll see everyone back here at 1.30.
Yeah. So we can do that.
We just go over here and get my SGT.
So actually, yeah, but I'm clear because we're covered. I guess after all of them are probably just source domain or source line and domain way.
Yes. Yeah. I don't even know what I'm presenting. Don't worry. It's two minutes.
Okay. So I think basically you just narrate over. I think the exact time to that's great.
Um it should be that one. Oh no.
That's good enough. Oh, you have power points to you. You want me to read it?

Yeah, we voted. Great. Yeah. Again. Everyone, it's us again. Um we're here to talk about our capstone project.
And as you guys know, we've been working on this capsound project. So this is a small PowerPoint. I'm not gonna go through all of it. Because the last parts I don't even know what it's saying.
Um but the first part is here we built our models, you know, phase one model, this contained all our staging models, our integration models, the final output, the reconciliation passes, these are all like data quality checks that we're using to make sure that the job and production looks good.
Here's our build tests and all our airflow DAGs that are required to run these jobs. And we're all experts in Airflow now, so we know what that means.
Um we have the source data here. We had there's trading data, there's CRM, fun references, security, portfolio management. And we here are here in the middle where we created this new product, and this new product we created is for uh looking at data for advisory leadership, portfolio oversight.
You know, I'm just reading these words now. Um so let's go to the next page.
We've created seven models. Um there are seven source aligned tables, so that means there's seven sources, and within those sources we've have about nine models, nine ETL models to eventually create our output tables.
And I will switch to a different document to talk about our PRD. And this is a lot of words, but we basically tackled what was it, Mimi? Portfolio summary and advisor book.
Portfolio summary and advisor book. So there were several questions that we wanted to answer was like um for each portfolio and each advisor. This is basically for them to understand the health of their portfolio to see how many assets are under management, all those uh good stuff that advisors generally like to look at.
There were some challenges that we ran into in this, and we have a we also have a challenge document. We actually looked and went crazy on the data.
We saw that like some trades were happening before the inception date. And so

we added a data quality rule for that. I um like is that is that in this challenge document?
Or do we do we eventually scratch it out? Uh oh yeah, so like some trade dates before the portfolio inception. So that's a little bit weird, right?
How are you making a trade before the portfolio even existed? Um we weren't sure if this was an issue in the data, so we decided, hey, let's let our business users know that this is happening, and we will just keep it in there.
And if it's an issue for them, then we can let them know that we can add a data quality check here. Or if it's meant to be and there's an actual business solution or some explanation for it, then we let it we let it happen.
That that tends to happen a lot, so this is a good example of that. Um real world example. Uh and yeah, I think that's it. This is we ran we we tackled two jobs and we were able to run it, and you can see the airflow jobs and you can see our Databricks catalogs and you'll be able to see the data.
So we got key name. Uh pretty, it's a wonderful team. Oh, is that uh yeah. Now once group two. What's your thing? Five. Now group now group two, five.
Okay. So uh as the as the challenge demanded, so we had the raw C dataset, most of it is what my friend just spoke, so technically it is the same thing.
What we have done, but what we focused on from the business output perspective is uh these two aggregates. Like one is the instrument activity, which uh like both are very much leadership uh important for the leadership.
One is it will validate the only trades and it contains an instrument based uh classification, like a grouping, and the other segment term, which is uh we know which client segments are performing better, and uh she's probably we're just we are just doing some transactions to figure that out.
These are the two main business outputs that we targeted, and uh this is some basic uh source to target mapping, uh just some technical stuff. Uh so what could make the result wrong?
These were like as I understand the objective, most of us did AI assisted development, but what we learned is some of these business things which made

might make the data go wrong, which is the latest price is the uh latest price fair and current, invalid trades, fee calculation, then uh no conversion of currency, which I think even the previous one pointed out, and reconsolation.
These were the main challenges when we think of the data revolving advisor portfolio trades and stuff like that. And considering these two business output, uh we had some justifications of why this was chosen.
Um for the questions of importance, like who uses it, like it shows which instruments or asset classes are traded the most, and some like as the DPT pipeline does it gets the raw seed data, then stages it, then finally gives a uh customer aligned uh output.
So it is the same stuff, but what happens is these these four or five things were considered for cleaning, like keep only the valid trades, the price conversion calculation and aggregate since both of our uh things uh deal with aggregates, and what could potentially make the result unworthy, like okay.
We created a product, but what what can make things uh what can go wrong? So trades pointing to unknown instruments would drop out of the join, so uh that's one uh thing which might be basically which we might use as an issue, and the same trait could be counted twice depending on how the raw data is, and uh value traded mixes.
So, in case we don't have conversions, then it'll reflect wrong. And in terms of the segment ORM, uh again, so the challenges in this aggregate is basically net buys again sales for each portfolio instrument to get positions, so uh this is a little challenging from the data perspective, and clean segment label.
So even though we are we are we are trying to group by the segment, we should be very clear that the data that we receive as the right segments attached to it.
Um so this was more like the uh output that we chose, and in terms of the PRD, we had a PRD created for it just using the AI catalyst, which pretty much speaks about uh why what is the current state and what is the future state and why now?
So the section was pretty clear why these two outputs made sense now. Of course, not capsule and certification, but the quarterly planning and uh the

dashboards and everything.
Uh see if it has a maybe a technical yeah, this is the funda fundamental of how it works internally, maybe all of it at the same time. So we have the seed data, from there we have our custom consumer aligned output, which is the fourth one in between we stage it and make it domain specific.
This is pretty standard across technically. So that's about it. I think I covered the two differences. Cool. Uh group two, which is five. Now we have group three, your team name is.
I got bully to doing the presentation group three. Thank you.
Do you want to take this? I gotta rephrase that. We got doing the presentation. I'll go to the back. And in both restart required. I'll go to the back.
Actually, yeah, I'll stay here. Yeah, yeah, yeah. So we did everything you guys did. Uh just presenting it kind of in a unique CG way. Um, but our two business outcomes that we chose is this is kind of a summary, the trustworthy view of the portfolios and advisor books.
We'll go through in my trusty man, Simon will kind of go through what we did. I doubt it's different than what you guys did, which is you know why we've learned so much of the same.
And thanks to our great instructors. Um, but we'll go through at a glance our ERD, our data model, um, and then we have a quick summary of our PRD.
Yes. And then hopefully we get a hat. Yes. I think I've already got hats, but I want another one. I want another one for sure. But uh the two business outcomes that we chose were the portfolio summary and also the visor book.
So we really did build very similar things that you guys did, we work backwards, you know, have all like the air resolve, but then figure out how we started.
And um from those outputs, we're able to determine what sources that we work with, being um I believe it was advisor, CRM, I believe also trays and also fund summary for the portfolio summary, and also we work with uh report advisor book, I mean use the sources from CRM, and also additionally the fun report as well, I think.

But yeah, that's those are two and sources um with this we're able to define a soon uh endpoint solution. We I believe we use Databricks, we propose Databricks to do all the DBT work and such like that.
And yeah. Yeah, he summarized without going through it. You gotta show the presentation. Wow, yeah, yeah. Yeah, so pretty much again. This is just a showing what Simon kind of described and what you guys all went through as well.
We do have those sources laid out. We use all those seven seeds um to finally get to our consumer reports. This is our beautiful ERD that we kind of created to kinda help us identify and have those discussions as a team and building um our PRD.
Um and then we went through some of the validation uh caveats that were pulled out from the document itself. Um I don't know if there's anything else we'd want to highlight there.
Um we also cross over like definitions that are like unclear throughout the requirements, so we gave like central meeting, so people don't get confused, and then there's also some so there is something to find something that can be used by like either agents or the personnel involved.
The data, yes. We also have some uh defined data quality as well, so make sure that everything is transformed, so it's also transformed, and it can be interpreted in the ways.
Source of it. That's exactly right. He summarizes in last words, and then we have just a couple of uh call outs with uh naming those data owners, data approvals, or not data approvals.
Well, yes, data approvals and validation. Um I think that's it. That's all we have. Um how did you generate our file? Um all by hand, you know, hard work, they say we're just natural.
Yeah, they say you can't work out or you can't outwork AI as a classes. Thank you to I'm the Engole. Least but not last. I don't know. Last least.
Something like that.

So I use the trick from the first day to create the summary document. And you know, uh first we create a PRD. Um you know, which is just showing where the data pretty much did uh what everyone else did today.
Uh so as a team we only decided to do um two uh portfolio summary and uh advisor book. Yeah, the first two. But then I almost got to the end of the phase two, so there is more in my documents.
Um so going back, I think this one is summarizing data contract and everything this page. So again, you know, just uh following everything it did create some nice uh lineage and graphs for me, uh focused on these two today uh for the whole team and uh you know some data contracts there uh and then some calculations that we had to you know kind of think through.
Um the basis points was a tricky one because we were oh, do we divide by thousand or by ten thousand? So we have to Google that. Um you know, yeah, just very cool document that they I was able to to help with.
They I also gave you know what should the readers not assume? Um some points. And moreover, there is just summary of the work. What was the hardest part of phase two?
Um the hardest part uh the imports? Yeah, that's where I got you know that's where I stopped. Okay. But yeah, I wouldn't put anything if I can create a bit more short and up until that point was anything.
Anything else? No, I mean yeah, just also created. Um like I ask ID, hey, can you also add just summarizing the today's work, everything I did today in one page, and AI is pretty good.
Very good job. Okay, great. Do we do we feel we can create the product and it works? Yeah, yes. Whoa, cool. Nice. Okay, then we'll no one. No one can ask for more.
Therefore, you're done.
